PROJECT SYNOPSIS

Content Creation and Marketing Copy Generation using Effective Prompts

AI Careers for Women — LinkedIn Fellowship | AICW Fellowship Program 2026

Student Name	Shreya Chaturvedi
Email	shreyachaturvedic@gmail.com
Guide / Mentor	Ms. Uma Maheshwari
Institution	Graphic Era Hill University
Fellowship	Edunet Foundation · Microsoft · LinkedIn · SAP
Project Domain	AI Chatbot / Prompt Engineering

1. Introduction

This synopsis presents a concise overview of the project undertaken as part of the AICW (Artificial Intelligence in the Contemporary World) Fellowship Program 2026, a collaborative initiative by the Edunet Foundation in partnership with Microsoft, LinkedIn, and SAP. The project investigates how structured prompt engineering can improve the quality of AI-generated marketing content, making AI tools practically useful for non-technical users without any programming background.

2. Problem Statement

A widely overlooked barrier to AI adoption among small businesses and non-technical users is not the unavailability of AI tools — it is the inability to communicate with them effectively. Most users interact with AI systems through vague, unstructured prompts, which produce generic, off-brand, or commercially unusable outputs. The core problems this project addresses are:

- Ineffective Prompting: Non-technical users lack the skills to write context-rich, structured prompts, resulting in generic and off-brand AI outputs.
- Inconsistency: There is no repeatable framework for non-technical users to reliably replicate good-quality AI content.
- Underutilisation: Disappointing first-pass outputs cause users to abandon AI tools that could genuinely transform their productivity.
- Structural Gap: No simple, beginner-friendly framework exists to guide non-technical users through prompt design specifically for marketing content.
- Trust and Data Security Concerns: Hesitation around AI reliability further compounds the adoption barrier.

3. Proposed Solution

The project proposes a structured prompt engineering methodology that any non-technical user can follow — without writing a single line of code. The solution is built around three key components:

Standardised Content Brief Schema

A reusable eight-field template (Product Name, Brand Name, Target Audience, Tone of Voice, Key Features/USPs, Content Type, Desired Length, and Call to Action) ensures every AI prompt is given sufficient context — eliminating vague inputs as the root cause of poor outputs.

Four Prompt Engineering Techniques

- Role Prompting — Assign an expert identity to the AI before the task.
- Few-Shot Prompting — Provide 2–3 example outputs to anchor tone and style.
- Chain-of-Thought Prompting — Instruct the AI to reason step by step for structured content.
- Iterative Refinement — Follow up with targeted correction prompts to polish first drafts.

Microsoft 365 Ecosystem

Microsoft Copilot was used as the primary AI tool (free tier), Microsoft Excel for tracking and dashboard visualisation, and Microsoft Copilot Studio for exploring deployment pathways — all tools already familiar to most small business users with zero additional cost.

4. Objectives

- Develop a thorough understanding of prompt engineering as a discipline, including the theoretical basis of different techniques and their practical implications.
- Design effective, reusable prompts for five distinct marketing content categories: product descriptions, social media captions, email marketing copy, brand taglines, and blog introductions.
- Test these prompts using Microsoft Copilot across all fifteen content briefs and evaluate outputs using a defined five-criterion quality rubric.
- Compare the performance of different prompting techniques across content types to identify which techniques deliver the strongest results and why.
- Compile a reusable prompt library that students, small business owners, and non-technical users can apply directly.
- Document the entire process clearly so the methodology can be understood, reproduced, and extended by other researchers and practitioners.

5. Methodology

The project follows a four-stage iterative cycle — Prompt → Generate → Evaluate → Refine — mirroring professional content production workflows.

Stage 1	Data Input: 15 structured content briefs created using the 8-field schema across 5 categories (3 briefs each).
Stage 2	Prompt Construction: Prompts built using one or more of the four techniques and submitted to Microsoft Copilot.
Stage 3	Quality Evaluation: Each output scored against a 5-criterion rubric (Relevance, Tone Match, Creativity, Persuasiveness, Clarity) on a 1–5 scale, before and after refinement.
Stage 4	Iterative Refinement: Outputs below 4.0 received targeted follow-up correction prompts; refined scores recorded.

6. Key Results

The overall average quality score improved from 3.44 to 4.55 out of 5.0 — a 32.6% improvement — consistent across all five content categories without exception. Results by content type are shown below:

Product Description	Role + Few-Shot	3.4 / 5	**4.6 / 5**
Social Media Caption	Role + Tone Control	3.6 / 5	**4.5 / 5**
Email Marketing Copy	Template + Chain-of-Thought	3.3 / 5	**4.4 / 5**
Brand Tagline	Zero-Shot Iterative	3.2 / 5	**4.3 / 5**
Blog Introduction	Role + Chain-of-Thought	3.7 / 5	**4.7 / 5**
Overall Average	**—**	**3.44 / 5**	**4.55 / 5**

The largest absolute gain was for Brand Taglines (+1.1 points), confirming that highly creative, open-ended tasks benefit most from structured prompting. Microsoft Copilot performed strongest on formal and structured content (emails and blog introductions). All results were tracked and visualised in a Microsoft Excel dashboard with bar, pie, and line chart views.

7. Key Findings

- Structured prompting produces consistent, cross-category improvement — the methodology is not sensitive to content type.
- Prompt specificity is the primary driver of output quality; the more context provided, the less the AI infers incorrectly.
- Few-shot prompting excels at tone and voice alignment — critical for social media captions.
- Iterative refinement is essential, not optional; AI content creation is a dialogue, not a single-query transaction.
- Productivity gains were substantial: well-structured prompts reduced content creation time by over 80% per piece.

8. Scope and Limitations

The project covers five marketing content types across fifteen fictional brand briefs. Tools are limited to Microsoft Copilot, Excel, and Copilot Studio. The project does not include ML model training, social media API integration, or live deployment. Key limitations include: fictional dataset (real-world brand constraints not tested), single-evaluator scoring (inter-rater reliability not assessed), and free-tier Copilot usage limits. All content was generated for academic demonstration purposes only.

9. Future Work

- Integration with Microsoft Power BI for interactive, real-time filtering dashboards.
- Use of Microsoft Copilot Studio to automate prompt generation into a deployable content tool.
- Expansion to real-world business applications with live marketing campaigns.

- Multi-evaluator validation to establish inter-rater reliability and elevate results to externally validated measurements.
- Extension to additional content types: video scripts, WhatsApp marketing messages, press releases, and pitch decks.
- Multilingual adaptation to generate content in Hindi and other regional Indian languages.

10. Conclusion

This project demonstrates, with measurable evidence, that structured prompt engineering reliably improves the quality of AI-generated marketing content — without any programming, AI expertise, or specialist tools. The overall average quality score improved by 32.6% across fifteen content briefs and five content categories, achieved entirely within a standard Microsoft 365 account.

The most important conclusion is conceptual: the barrier between a non-technical user and professional-quality AI output is not technology — it is communication. Prompt engineering is the next foundational literacy skill for anyone who works with information. This project equips students and small business owners with a practical, reusable, and immediately applicable framework to bridge that gap.
